

It is important to protect the Earth because most of the things we are eating today come from the Earth. For example, plants grow on the Earth, they need to be conserved to stay there for a long time so that people can survive.

Protecting the Earth is critical because nowadays people are cutting trees and using them to make charcoal, which is the largest cause of pollution. Pollution can also harm the people and plants. Acids mix with the rain and destroy the plants so that causes people to live without food.

I think it is important to protect the Earth because we get our needs from the Earth. We cannot live without plants because we get food from plants. We need somewhere to live in the Earth. If we destroy all the plants, where will the animals rest? What will they eat? We also get food from animals, which get food from plants. Pollution is one of the most harmful things to the Earth and damages the plants, water and animals.
